

Report Analysis Sales Convenience Market

✓ Executive Summary

This report analyzes 1,000 transactions from a convenience market dataset to identify key performance indicators across sales revenue, customer behavior, and product performance. Data was cleaned and analyzed using SQL, with findings summarized here to support inventory and marketing decisions.

✓ Methodology

Data was queried and aggregated using SQL (GROUP BY, window functions for ranking). Prior to analysis, product-category mismatches were identified and corrected by aligning each product's category to its most consistent value. Unit price variation was confirmed to be legitimate transaction-level data and left unmodified.

✓ Key Insights

Product Performance

- Shampoo generated the highest total revenue \$27,041 and the highest quantity sold 2238 units.
- Notebook generated the highest tax contribution \$1,621
- Apple recorded the lowest revenue \$19,614 and lowest quantity sold 1741 units of any product.
- Although Notebook commands the highest average unit price, Shampoo generates the highest total revenue due to stronger sales volume, illustrating that per-unit price alone doesn't determine overall performance

Customer Demographics

Metric	Male	Female
Transactions	528	472
Avg. spend/transaction	\$121.82	\$114.97

- Male customers generated more total revenue, driven by both higher transaction volume and higher average spend per visit.
- Top Product by Gender

GENDER	1st	2st
MALE	Shampoo	Orange Juice
FEMALE	Notebook	Detergent.

- Apple ranked lowest for both genders.

Membership Status × Gender

Segment	Top product	Lowest product
Male – Normal	Shampoo	Apple
Female – Normal	Orange Juice	Apple
Male – Member	Orange Juice	Apple
Female – Member	Notebook	Orange Juice

Loyalty & Reward Points

- Male members accumulated more total reward points than female members 3100 vs 2957.
- Shampoo generated the most reward points among members, consistent with its strong sales performance.
- Apple generated the fewest reward points, in line with its lower price point and lower purchase volume — not necessarily an indicator of quality or demand issues.

Branch & City Performance

This dataset contains 2 branches mapped across 3 cities: Branch A covers both New York and Chicago, while Branch B corresponds to Los Angeles alone.

- Branch A generated the highest total revenue \$82,811 , which is expected given it aggregates two cities rather than one — this should be read as a structural factor, not a performance signal on its own.
- Within Branch A, Chicago recorded higher sales activity than New York
- In Chicago, Shampoo ranked first in quantity sold, followed by Orange Juice; Apple was lowest.
- In New York, Shampoo led by quantity, followed by Notebook; Orange Juice recorded the lowest quantity.
- In Branch B (Los Angeles), Orange Juice generated the highest quantity sold, while Apple was lowest.

✓ Recommendations

- Maintain sufficient Shampoo inventory across all locations to prevent stockouts, given its consistent top performance in both revenue and quantity.
- Increase stock allocation for regionally preferred products — Orange Juice in Chicago/**Los Angeles** and Notebook in New York — based on localized demand patterns.
- Investigate low performance of Apple and (regionally) Orange Juice through pricing review, placement, and customer feedback, rather than assuming a demand or quality issue from sales data alone.
- Consider a loyalty promotion tied to Shampoo purchases, since it's already the strongest reward-point driver and could reinforce repeat member engagement.
